The **Series RH-R Humidity Transmitter** is the ideal transmitter for those applications where space is limited. The compact sensor is protected by a removable filter. It can be mounted up to 16 feet away from the weatherproof base. The Series RH-R is ideal for environmental chambers, rubber bladder burst detection systems and air handler applications.

### INSTALLATION

**Warning:** Disconnect power supply before installation to prevent electrical shock and equipment damage.

Make sure all connections are in accordance with the job wiring diagram and in accordance with national and local electrical codes. Use copper conductors only.

Do not make changes to the cable lengths. Sensors are factory calibrated for supplied length of cable. Optional lengths are available from the factory.

**Caution:** Use electrostatic discharge precautions (e.g., use of wrist straps) during installation and wiring to prevent equipment damage.

Avoid locations where severe shock or vibration, excessive moisture or corrosive fumes are present. NEMA Type 4X (IP65) housings are intended for outdoor use primarily to provide a degree of protection against wind-blown dust, rain, and hose directed water.

Do not exceed ratings of this device, permanent damage not covered by warranty may result. The Series RH-R Humidity Transmitter was not designed for AC voltage operation.

### SPECIFICATIONS

<table>
<thead>
<tr>
<th>Service: Dry clean air.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relative Humidity Range: 0 to 100% RH.</td>
</tr>
<tr>
<td>Temperature Range: -40 to 140°F (-40 to 60°C).</td>
</tr>
<tr>
<td>Accuracy: ±2% 10 - 90% RH; ±0.9°F @ 72°F (±0.3°C @ 25°C).</td>
</tr>
<tr>
<td>Hysteresis: ±1%.</td>
</tr>
<tr>
<td>Repeatability: ±0.1% typical.</td>
</tr>
<tr>
<td>Temperature Limits: -40 to 140°F (-40 to 60°C).</td>
</tr>
<tr>
<td>Storage Temperature: -40 to 176°F (-40 to 80°C).</td>

OSA (Outside Air)
The transmitter should be mounted under an eave, shield, or in an area that is out of
the elements or direct sunlight.
1. Remove the cover plugs from the face of the unit and the top cover.
2. Position the transmitter where it is to be mounted and mark the mounting holes in
each corner of the housing.
3. Drill or punch out marked locations.
4. Place the transmitter box over mounting holes on wall and align. Install wall mount
screws (not provided) in mounting holes.
5. Proceed with wiring according to Figure 2.
6. Replace cover and cover plugs on the face of the unit.

WIRING
Use maximum 18 AWG wire for wiring terminals. Refer to Figure 1 for wiring information.

4-20 mA Output Models
4-20 mA output units may be powered with a 10-35 VDC supply. The following
describes the proper wiring of these transmitters with mA output.

The Series RH-R transmitter is designed as a two-wire 4-20 mA device with two
channels. The channels are common on the positive side of the current loops. Sensor
excitation power is derived from the relative humidity channel, so power must always
be applied to that channel. If the temperature channel is not equipped or used, it can
be left disconnected. The basic two-wire connection is shown in Figure 1.

Checkout
1. Verify that the unit is mounted in the correct position.
2. 4-20 mA Models:
   Verify appropriate supply voltage. The transmitter requires a minimum of 10 and a
maximum of 35 VDC at its connection for proper operation. Choose a power supply
with a voltage and current rating which meets this requirement under all operating
conditions. If the power supply is unregulated, make sure voltage remains within these
limits under all power line conditions. Ripple on the supply should not exceed 100 mV.
Loop Resistance – The maximum allowable loop resistance depends on the power
supply voltage. Maximum loop voltage drop must not reduce the transmitter voltage
below the 10 VDC minimum. Maximum loop resistance can be calculated with the
following equation. \( V_{ps} = 10.0 \text{ VDC} \):

\[
R_{max} = \frac{V_{ps} - 10.0}{20 \text{ mA}}
\]

Some receivers, particularly loop powered indicators, may maintain a fixed loop
voltage to power the device. This voltage drop must also be subtracted from the power
supply voltage when calculating the voltage margin for the transmitter. The following
equation takes this into account. \( V_{rec} \) is the receiver fixed voltage.

\[
R_{max} = \frac{V_{ps} - V_{rec}}{20 \text{ mA}}
\]

MAINTENANCE
Upon final installation of the Series RH-R Temperature/Humidity Transmitter and
the companion receiver, no routine maintenance is required. A periodic check of the
system calibration is recommended. The Series RH-R is not field serviceable and
should be returned if repair is needed (field repair should not be attempted and may
void warranty). Be sure to include a brief description of the problem plus any relevant
application notes. Contact customer service to receive a return goods authorization
number before shipping.

Note: For models with RH and temperature, the RH output must be hooked up. If the
RH outputs is not required, wire the "_" terminal of the power supply to terminal 1.
