DIMENSIONS

1/4 MALE NPT WITH 3/4 [19.05] WRENCHING HEX

Ø5 [127]
9/32 [7.14]
27/32 [21.43]
1-59/64 [50.00]

Ø4-15/32 [115.90]
3X 1/8 [3.18]
2X 5/16 [7.93]

1 [25.40]

3-1/2 [88.90]
1-5/8 [40.88]
3-3/32" [78.58]

1/2 FEMALE NPT CONDUIT ENTRY
### SPECIFICATIONS

**Service:** Compatible liquids and gases.

**Wetted Materials:** 316 L SS.

**Housing:** Polycarbonate.

**Accuracy:** ±1% of FS including linearity, hysteresis, and repeatability (indicator and transmitter).

**Stability:** < ±2% of FS per year.

**Pressure Limits:** Ranges up to 6,000 psi: 1.5 x range; 8,000 psi range: 10,000 psi.

**Temperature Limits:** Ambient: 20 to 140°F (-6.6 to 60°C); Process: 0 to 176°F (-18 to 80°C).

**Compensated Temperature Limits:** 32 to 122°F (0 to 50°C).

**Thermal Effect:** ±0.05% of FS/°F.

**Process Connection:** 1/4” NPT male, 1/4” BSPT male, or 7/16” SAE.

**Display:** 4-digit backlit LCD (Digits: 0.60” H x 0.33” W).

**Display Update:** 600 ms (dampening set to 1).

**Power Requirements:** 12-28 VDC / AC ( ~ ) 50/60 Hz. (Can work at 8 VDC for 45 s). For T5 option: 14-30 VDC / AC ( ~ ) 50/60 Hz. For -HV option: 120-240 VAC.

**Power Consumption:** 12-28 VDC/VAC: 2.5 watts; 120-240 VAC: 4.5 watts.

**Electrical Connections:** Removable terminal blocks with two 1/2” female NPS conduit connections.

**Enclosure Rating:** Weatherproof type 4X IP65 (IP65 not evaluated by UL).

**Warm Up Time:** <10 s.

**Mounting Orientation:** Any position.

**Weight:** 1.18 lbs (535 g).

**Installation Category:** II (transient over-voltage).

**Pollution Degree:** 2.

**Altitude Limit:** 6560 ft (2000 m) max.

**Environment:** Intended for indoor and outdoor use.

**Humidity:** 0 to 95% RH up to 104°F (40°C) non-condensing, 10 to 50% at 140°F (60°C) non-condensing.

### SWITCH SPECIFICATIONS

**Switch Type:** 2 SPDT relays.

**Electrical Rating:** 5A @ 120/240 VAC ( ~ ) 50/60 Hz, 1A @ 28 VDC.

**Repeatability:** ±1% of FS (switching only).

**Set Points:** Adjustable 0-100% of FS.

**Switch Indication:** External LED for each relay on the front panel.

**Switch Reset:** Manual or automatic.

### TRANSMITTER SPECIFICATIONS

**Output Signal:** 4-20 mA, 1-6 VDC, 1-5 VDC, 0-5 VDC, or 0-10 VDC (direct or reverse output selection).

**Minimum Excitation:** 14 VDC.

**Zero and Span Adjustments:** Menu scalable within the range.

### Display

The EDA has two displays: a lower larger display and a smaller upper display. The Home Display is the normal display while the control is in operation if there are no errors or functions active. The Home display will indicate the process variable at the current condition with the lower display and the selected pressure units for the process variable with the upper display. When programming the unit both displays are also used. The Programming Chart in this instruction manual indicates what both displays show while programming the unit. For programming descriptions in this instruction manual the format used is “lower display – upper display”. For example Ctrl – 1SP shows that Ctrl would be in the lower display and 1SP would be in the upper display.

When the user presses the E key to edit an item’s value the upper display will flash “EDIT” and the lower display will blink. When the user presses the E key to then save the edit to the value the upper display will flash “SAVE” and the lower display will stop blinking.
1.0 INSTALLATION

1.1 UNPACKING
Remove the EDA from the shipping carton and inspect for damage. If damage is found, notify the carrier immediately.

1.2 MOUNTING
The EDA can be pipe, panel, or surface mounted. For pipe mounting thread the unit into a mating female fitting on the pipe. Use a wrench on the 3/4” hex at the base of the housing to tighten the unit to the mating fitting. Do not thread the unit in by force on the housing. For panel mounting, insert the unit into the panel opening and secure in place with the machine screws and adapters provided with the unit as shown in Figure 1 below. Maximum panel thickness is 1/8” (3.5 mm) with supplied screws. For surface mounting, panel mount the unit into the A-EDA-BRK mounting bracket (See the Dwyer catalog or website for ordering details) also shown in Figure 1. The unit can also be directly surface mounted, as shown in Figure 2, with the proper panel cutout for the conduit entrances. Support the pressure connection hex with a wrench if attaching a fitting to the unit in the case of panel or flush mounting so that the pressure connection does not twist. Use a small amount of plumber’s tape or other suitable sealants to prevent leaks around fitting.

![Figure 1: Panel mounting and mounting in A-EDA-BRK bracket](image1)

![Figure 2: Surface mounting](image2)
1.3 ELECTRICAL CONNECTIONS

**ELECTRIC SHOCK HAZARD.** DISCONNECT POWER BEFORE MAKING ELECTRICAL CONNECTIONS. Failure to do so will result in injury or death.

**CAUTION.** Do not exceed the specified supply voltage rating. Failure to do so may result in permanent equipment damage.

**CAUTION.** Do not allow wire to touch or press on PCBA components when fishing wire through the conduit connection. Failure to do so may result in damage to the circuitry.

**NOTICE.** To maintain Type 4X rating of the enclosure, 1/2 NPT conduit fittings must have a UL Type 4X outdoor rating.

*Note:* Installation must be made in accordance with local codes and regulations.

Electrical connections are made to the removable terminal blocks inside the enclosure. Remove the top back cover, do not remove bottom cover. Feed stripped and tinned leads through the conduit opening and connect them as shown in Figure 3. The EDA provides two 1/2˝ NPT female ports for conduit connection. The conduit connections must be made such that condensation is not allowed to enter the sensor housing. If necessary install a conduit breather drain in a separate conduit body to prevent buildup of moisture. It is recommended that shielded twisted pair wire be used for the transmitter output option if the potential exists for interference from external noise sources. When replacing top back cover tighten screws to 2 ±.25 in lbs.

**Figure 3: Wiring**

An external power supply of 12-28 VDC/AC with minimum current capability of 200 mA must be used to power the unit (-HV option must be 120-240 VAC). The power supply connection is not polarity sensitive so the positive and negative connections may be made to either terminal of CONN9 terminal block.

For voltage output option, connect the voltage receiver (-) to terminal 1 and voltage receiver (+) to terminal 2 of the CONN10 terminal block. For current output option, connect the current receiver (-) to terminal 3 and current receiver (+) to terminal 4 of CONN10 terminal block. **DO NOT APPLY EXTERNAL POWER TO CONN10 TERMINALS - PERMANENT DAMAGE NOT COVERED BY WARRANTY WILL RESULT.**

Loads can be connected to connectors CONN7 and CONN8 terminal blocks based on the Control settings:
- For single set point mode (Ctrl-L-1SP), connect the Load to SP1 relay (CONN7).
- For two set points mode (Ctrl-L-2SP), connect the Load1 to SP1 relay (CONN7) and Load2 to SP2 relay (CONN8).
- For single set point and alarm mode (Ctrl-L-SPAL), connect the Load1 to SP1 relay (CONN7) and Load2 to ALARM relay (CONN8).

**Wiring**

An external switch or circuit breaker should be added during the installation as a disconnecting device. The switch or circuit breaker must meet the requirements of IEC 60947-1 and IEC 60947-3, shall disconnect all current carrying conductors, and shall not interrupt the protective earth ground. The disconnecting switch or circuit breaker must be marked or labeled with the symbols “I” for on and “O” for off, per IEC 60417-5007 & IEC 60417-5008 and shall be marked as “Disconnecting Device”. Do not position the EDA in a space where it is difficult to operate the disconnecting device that provides power. 300 V 18 AWG/0.75 mm² wiring with PVC or equivalent insulation with 94-V0 or FV-0 flammability rating is recommended for the switch outputs and power. Use only copper wire rated to 60°C minimum. Terminal blocks rated for 16-22 solid or stranded copper conductor. 6 lb in is suggested tightening torque.

**NOTICE**

As a permanently installed piece of equipment, a power disconnect switch, circuit breaker, or other approved disconnect device must be installed in close proximity to the installed board and within easy reach of the operator. This disconnect device must include a label indicating its function as a mains disconnect. A circuit breaker or fuse device is recommended (see Figure 3).

2.2 SET POINTS AND ALARMS

Setting Set Points and Alarms

Set Point Adjustment
Adjusting the set points is quick and simple. Instead of setting a set point and dead band, simply adjust SP1H, Set Point 1 High, and SP2H, Set Point 2 High, for the desired relay turn on point, and then adjust SP1L, Set Point 1 Low, and SP2L, Set Point 2 Low, for the desired relay turn off point.

In the above graph, an instrument with a 100 psi range would have the SP1 relay turn ON at 80 psi and OFF at 40 psi. SP1H sets the relay turn ON point, and SP1L sets the relay turn OFF point.
Relay Action

The relays outputs normally function in the direct acting mode, which means the relays turn ON with an increase in pressure. SP1 and SP2 may be configured to act as reverse acting relays (refer to the Ctrl menu item). When set for reverse acting, SP1H and SP2H set the relay turn OFF point, and SP1L and SP2L set the relay turn ON point. The above graph demonstrates direct and reverse action on process (pressure) change.

Alternating (Lead/Lag) Operation
The EDA is designed to easily operate a pair of pumps in an alternating operation to minimize pump wear. The unit has programmable on and off set points for pump one and two. If the lead/lag feature is turned off then the relays remain attached to their corresponding set points, SP1H and SP1L control relay 1 (pump 1) and SP2H and SP2L control relay 2 (pump 2). There is no alternating function.

If lead/lag feature is turned on then the relays will alternate with set points SP1H and SP1L to SP2H and SP2L with every cycle of set points. The Last relay turned off will be last relay turned on with the next cycle. On the first cycle on increase of pressure, assuming direct acting, the SP1 relay (pump 1) will come on and then on further increase of pressure the SP2 relay (pump 2) will come on. On the subsequent decrease of pressure the SP2 relay (pump 2) will come off and then the SP1 relay (pump 1) will come off. When pressure increases on the next cycle the relay used on the last cycle for SP2 will now be used for SP1, so that SP1 now controls pump 2 and SP2 now controls pump 1. Even if SP2 is not used on the pressure cycle the relays still alternate on next cycle.
SEE PAGE 17.
2.4 MAIN MENU SELECTIONS

Menu Selections
Press the **MENU** button to start the menu so that the upper right displays reads **MENU**. Press the ▼ key to advance to the next menu item. You can press the ▲ key to go back to the previous menu. Press the E key to enter a menu.

**SECr** Security Menu
Lock out access to set point and alarm settings, or lock out access to all settings.

**OPEr** Operation Menu
Select pressure units, zero the display, and turn the backlight on or off.

**Out** Output Menu
Select relay mode of operation, alternating function, time delay, and lamp indication.

**diS** Display Menu
Monitor and adjust display related settings: Peak, Valley and Dampening.

**AdU** Advanced Functions Menu
Modify advanced function parameters: transmitter output scaling, direct or reverse output setting, calibration, or restoring factory default calibration.

**tEst** Test Menu
Simulate input over the range without pressure to test switch and transmitter output function.

**FAIL** Failsafe Menu
Set the relay and transmitter outputs to certain preset values when failsafe conditions occur. Error codes will show on the display indicating the problem. User chooses if relay is de-energized, energized, or no action taken. With transmitter option, user chooses an output of 3.6 mA, 22 mA, or no action taken.

Menus and Values

**SECr** Security Menu

**SECr** When the security item is selected, the present security level is displayed in the upper right hand display. To change the security level, adjust the number displayed to the password value in the Password Table, shown below, by pressing the ▲ or ▼ key and then pressing the E key at the desired security level.

<table>

</table>

The password values shown in the table cannot be altered, so retain a copy of these pages for future reference.
Operation Menu

Pressure Units
With the display reading Unit - PSI, press the E key. The upper display will blink. Press the ▼ key to change unit then press E key to save the new unit.

- PSI: Pounds per square inch
- FS: % of full scale
- OZIN: Ounces per square inch
- CMWC: Centimeters of water column
- MPA: Megapascals
- BAR: Bar
- MBAR: Millibar
- KPA: Kilopascals
- FTWC: Feet of water column
- KGCM: Kilograms per square centimeter
- MMHG: Millimeters of mercury
- INWC: Inches of water column
- INHG: Inches of mercury

2: Backlight stays on for 2 minutes.
**OUt Output Menu**

**CtrL**  
Control Mode  
- **1SP** Single set point.  
- **2SP** Two fully independent set points.  
- **SPAL** Single set point and alarm.  

**1SP**  
**SP1**, Set Point 1, Reverse or Direct Acting  
**DIR** Direct. Relay turns on with increasing pressure.  
**REV** Reverse. Relay turns on with decreasing pressure.  

**DEL1**  
**SP1**, Set Point 1, Time Delay  
Sets the amount of time a set point condition must be continuously met before the set point condition is recognized. The **DEL1** delay is adjustable from 0-60 seconds.  

**LED1**  
**SP1**, Set Point 1, Lamp  
**OFF** The SP1 LED on the front panel turns OFF when the SP1 relay turns OFF.  
**ON** The SP1 LED on the front panel turns ON when the SP1 relay turns ON.  

The following **SP2** function values are only activated when **CtrL** is set to **2SP**:  

**2SP**  
**SP2**, Set Point 2, Reverse or Direct Acting  
**DIR** Direct. Relay turns on with increasing pressure.  
**REV** Reverse. Relay turns on with decreasing pressure.  

**DEL2**  
**SP2**, Set Point 2, time delay  
Sets the amount of time a set point condition must be continuously met before the set point condition is recognized. The **DEL2** delay is adjustable from 0-60 seconds.  

**LED2**  
**SP2**, Set Point 2, Lamp  
**OFF** The SP2 LED on the front panel turns OFF when the SP2 relay turns OFF.  
**ON** The SP2 LED on the front panel turns ON when the SP2 relay turns ON.  

**LdL9**  
Relay Alternation (See page 8)  
**OFF** There is no alternating function.  
**ON** Relays will alternate with set points **SP1H/L** and **SP2H/L** with every cycle of set points. **2SP** control mode only.
The following alarm function menu items are activated when Ctrl is set to SPAL:

**DELA**  
Alarm Delay  
Sets the amount of time an alarm condition must be continuously met before the alarm condition is recognized. The alarm delay is adjustable from 0 - 60 seconds.

**LEdA**  
Alarm Lamps  
- **OFF**  The ALLO LED or ALHI LED on the front panel turns OFF when the alarm relay turns OFF.  
- **ON**  The ALLO LED or ALHI LED on the front panel turns ON when the alarm relay turns ON.

**AL**  
Alarm Type (see Alarm Adjustment below)  
- **HIGH**  High alarm only.  
- **LOW**  Low alarm only.  
- **HILO**  For a high and low guard band type alarm. Share the same relay output.

**Alarm Adjustment**  
Alarm settings are dependent upon the selected alarm type. The EDA pressure controller alarm may be configured as a High Alarm, Low Alarm, or High/Low Alarm. Alarm settings may be set to anywhere within the range of the instrument. The dead bands of the alarms are fixed at 1% of full scale.

**ALrE**  
Alarm Reset  
- **AUTO**  Automatic reset.  
- **HOLD**  Manual reset. An alarm is reset by pressing the RST key on the front panel.

**ALiH**  
Low Alarm Inhibit  
- **OFF**  Alarm inhibit is off.  
- **ON**  Alarm inhibit is on.

**Note:** If ALiH is selected ON, a low alarm condition is suspended upon power up until the process value passes through the alarm set point once.
diS Display Menu

**PEAK**
The Peak feature stores the highest pressure reading the instrument has measured since the last reset or power up. At power up **PEAK** is reset to the present pressure reading. To manually reset the **PEAK** value, press the RST (RESET) key while in **PEAK**.

**VALY**
The Valley feature stores the lowest pressure reading the instrument has measured since the last reset or power up. At power up **VALY** is reset to the present pressure reading. To manually reset the **VALY** value, press the RST (RESET) key while in **VALY**.

**DAMP**
Dampening
Adjust from 1-15. Dampening stabilizes the display from instabilities due to things such as vibration and excessive pressure fluctuations. The dampening setting adjusts the amount of readings that are averaged for each display update. Adjust the dampening value until the display reads a stable value for the application.

AdU Advanced Menu

**POL**, Process Output Low, and **POH**, Process Output High are used to scale the transmitter output for a unit with the output option of 4-20 mA, 0-5 VDC, 0-10 VDC, 1-5 VDC, or 1-6 VDC. Below shows with 4-20 mA output option.

**POL**
Process Output Low
Set to the desired display reading for the 4 mA output. May be set from 2% below minimum scale up to **POH**.

**POH**
Process Output High
Set to the desired display reading for the 20 mA output. May be set from **POL** to 2% above maximum scale.

**CAL – ZERO**
Zero Calibration
DO NOT apply any pressure when performing this function. With the display reading **CAL - ZERO**, press the E key. The upper display will blink. Press the E key again to complete the zeroing of the instrument or press the MENU key to cancel.

**CAL – FS**
Full-scale Calibration
With the display reading **CAL - FS**, apply full-scale pressure to the unit, press the E key. The upper display will blink. Press the E key again to complete the calibration or press the MENU key to cancel.

**trAn** sets the transmitter output option function for a unit with the output option of 4-20 mA, 0-5 VDC, 0-10 VDC, 1-5 VDC, or 1-6 VDC. Below shows with 4-20 mA output option.

**trAn**
**DIR**
Direct Output. 4 mA output at zero, 20 mA output at full scale pressure.

**REV**
Reverse Output. 20 mA output at zero, 4 mA output at full scale pressure.

**CAL - DFLT**
Factory Default Calibration
With the display reading **CAL - DFLT**, press the E key. The upper display will blink. Press E again to restore the original factory calibration values or press the MENU key to cancel.
tEst Test Menu

When selected the unit simulates a pressure input over the range to test the programming and output function. To start an automatic simulated cycling through the pressure range press the E key. This test will run continually until the E key is pressed again. To manually adjust the simulated pressure press the ▲ or ▼ key to adjust the pressure value. To exit tEst press the MENU key.

FAIL Failsafe Menu

The Failsafe menu is used to set the relay and transmitter outputs to certain preset values when failsafe conditions occur. Error codes will show on the display indicating the problem. See Diagnostic Error Messages on the next page.

rEL Relay Output Failsafe Condition
- OPEN The relay is de-energized upon failsafe condition. The NO contacts will be opened, and the NC contacts will be closed.
- CLSE The relay is energized upon failsafe condition. The NO contacts will be closed, and the NC contacts will be opened.
- NORM No change applied to the relay upon failsafe condition.

OUTp sets the transmitter output option failsafe condition for a unit with the output option of 4-20 mA, 0-5 VDC, 0-10 VDC, 1-5 VDC, or 1-6 VDC. See below chart of transmitter output action according to output signal type.

OUTp Transmitter Output Failsafe Condition
- LOW Transmitter output goes to low failsafe condition.
- HIGH Transmitter output goes to high failsafe condition.
- NORM No change applied to transmitter output upon failsafe condition.

<table>
<thead>
<tr>
<th>Output Signal</th>
<th>4-20 mA</th>
<th>0-5 VDC</th>
<th>0-10 VDC</th>
<th>1-6 VDC</th>
<th>1-5 VDC</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOW</td>
<td>3.6 mA</td>
<td>-0.125 VDC</td>
<td>-0.250 VDC</td>
<td>0.875 VDC</td>
<td>0.9 VDC</td>
</tr>
<tr>
<td>HIGH</td>
<td>22 mA</td>
<td>5.625 VDC</td>
<td>11.250 VDC</td>
<td>6.625 VDC</td>
<td>5.5 VDC</td>
</tr>
</tbody>
</table>

FrEs Failsafe reset
- AUTO Automatic reset - Failsafe is reset automatically when the failsafe error condition is removed.
- HOLD Manual reset - Failsafe is reset when the MENU key is pressed.

5. MAINTENANCE/REPAIR

Upon final installation of the Series EDA, inspect and clean with water or damp cloth at regular intervals. The Series EDA is not field serviceable and should be returned if repair is needed (field repair should not be attempted and may void warranty.

This symbol indicates waste electrical products should not be disposed of with household waste. Please recycle where facilities exist. Check with your Local Authority or retailer for recycling advice.

6. WARRANTY/RETURN

Refer to “Terms and Conditions of Sales” in our catalog and on our website. Contact customer service to receive a Return Goods Authorization number before shipping the product back for repair. Be sure to include a brief description of the problem plus any additional application notes.
