The Series MS2 Magnesense® II Differential Pressure Transmitter combines stable Piezo sensing technology with additional features to reduce installation time and simplify ordering. In this second generation transmitter, we have added additional field selectable pressure ranges so that each model can have four selectable ranges along with four additional bidirectional ranges. When using the optional LCD display or the portable remote display tool, both Metric and English engineering units can be selected via on board dip switches. Dual current and voltage outputs allow users to simultaneously take either a current or voltage output to their building controller and have a local test circuit for verification of the output reading. The voltage output can be selected to be either 0-5 VDC or 0-10 VDC, while the current is always 4-20 mA. Both the current and voltage output can also be inverted. Alternatively, the MS2 can be ordered with either a BACnet or Modbus® Communications protocol that will allow the transmitters to be daisy-chained together.

Like the original Series MS, the second generation transmitter can be used as a linear pressure output or a linear velocity output with the square root extraction done in the transmitter. Additional parameters have been included on the MS2 to expand the connections directed down to prevent moisture from entering either the pressure ports or the electrical cable entry. The diaphragm must be vertical to minimize gravity effects on the diaphragm. Attach the mounting flange to a flat surface using three #8 x 1/2˝ pan head sheet metal screws. Do not over tighten.

Like the original Series MS, the second generation transmitter can be used as a linear pressure output or a linear velocity output with the square root extraction done in the transmitter. The diaphragm must be vertical to minimize gravity effects on the diaphragm. Attach the mounting flange to a flat surface using three #8 x 1/2˝ pan head sheet metal screws. Do not over tighten.

**SPECIFICATIONS**

**Supported Baud Rates:** 9600, 19200, 38400, 57600, 76800, 115200.

**Data Size:** 8.

**Parity:** None.

**Stop Bits:** 1.

**Service:** Air and non-combustible, compatible gases.

**Wetted Materials:** Consult factory.

**Accuracy:** ±1% FS for 0.15 in w.c. (40 Pa), 0.25 in w.c. (50 Pa), 0.5 in w.c. (100 Pa), 2 in w.c. (500 Pa), 3 in w.c. (750 Pa), 5 in w.c. (1250 Pa), 10 in w.c. (2 kPa), 15 in w.c. (3 kPa), 25 in w.c. (5 kPa), 28 in w.c. (6.975 kPa); ±2% FS for 0.1 in w.c. (25 Pa), 1 in w.c. (250 Pa), and all bi-directional ranges.

**Stability:** ±1% / year FSO.

**Temperature Limits:** 0 to 150°F (-18 to 66°C).

**Pressure Limits:** 1 psi max., operation; 10 psi burst.

**Power Requirements:** 10-35 VDC (2-wire), 17-36 VDC or isolated 21.6-33 VAC (3-wire).

**Output Signals:** 4-20 mA (2-wire), 0-5 VDC, 0-10 VDC (3-wire).

**Response Time:** Averaging 0 to 240 s, 2.5 Hz sample rate, 1.5 to 228 s for 95% step change.

**Zero and Span Adjustments:** Digital push buttons.

**Loop Resistance:** Current output: 0 to 1250Ω max; Voltage output: Min. load resistance 1kΩ.

**Current Consumption:** 40 mA max.

**Display (optional):** 5-digit LCD.

**Electrical Connections:** 3-wire removable European style terminal block for 16 to 22 AWG.

**Electrical Entry:** 1/2˝ NPS thread; Accessory (A-151): Cable gland for 5 to 10 mm diameter cable.

**Process Connection:** 3/16˝ ID tubing (5 mm ID); Max. OD 9 mm.

**Enclosure Rating:** IP66.

**Mounting Orientation:** Any orientation.

**Weight:** 8.0 oz (230 g).

**Agency Approvals:** BTL, CE.

**Electrical Connection:** The Series MS2 simultaneously transmits a 2-wire 4-20 mA current output and a 3-wire 0-5 V / 0-10 V voltage output via a removable European-style three conductor terminal block. The transmitter can be wired in one of the following three ways to utilize the current and / or voltage output. The range of the voltage output can be selected using the on board dip switches as described in the Dip Switch Settings section of this manual.

---

**INSTALLATION**

**Surface Mount:**

The transmitter can be mounted in any orientation. It is recommended to mount with the connections directed down to prevent moisture from entering either the pressure ports or the electrical cable entry. The diaphragm must be vertical to minimize gravity effects on the diaphragm. Attach the mounting flange to a flat surface using three #8 x 1/2˝ pan head sheet metal screws. Do not over tighten.

**Duct Mount:**

The transmitter should be mounted away from fans, corners, heating and cooling coils and other equipment that will effect the measurement of the pressure.

1. To mount the transmitter, drill a .562˝ (12.70 mm) diameter hole into the duct.
2. Insert transmitter probe into the duct.
3. Mark location of three mounting holes on duct using mounting flange as template.
4. Attach mounting flange to duct with three #8 x 1/2˝ pan head sheet metal screws. Do not over tighten.

**Agency Approvals:** BTL, CE.

**Electrical Connection:** The Series MS2 simultaneously transmits a 2-wire 4-20 mA current output and a 3-wire 0-5 V / 0-10 V voltage output via a removable European-style three conductor terminal block. The transmitter can be wired in one of the following three ways to utilize the current and / or voltage output. The range of the voltage output can be selected using the on board dip switches as described in the Dip Switch Settings section of this manual.
Power Supply
Refer to the below table for the required supply rating.

<table>
<thead>
<tr>
<th>Output Type</th>
<th>Power Supply Rating</th>
</tr>
</thead>
<tbody>
<tr>
<td>2-wire current</td>
<td>10-40 VDC (40 mA min)</td>
</tr>
<tr>
<td>3-wire voltage</td>
<td>17-40 VDC or 21.6-33 VAC (40 mA min)</td>
</tr>
<tr>
<td>Simultaneous current and voltage</td>
<td>17-40 VDC (40 mA min)</td>
</tr>
</tbody>
</table>

Choose a power supply with a voltage and current rating sufficient to meet the power specifications under all operating conditions. If the supply is unregulated, make sure that the output voltage remains within the required voltage range under all power line conditions. Ripple on the supply should not exceed 100 mV.

AC/DC Jumper Selection

**NOTICE** The jumper is factory set to AC. If DC power is applied while the jumper is set to AC, no damage will occur. However, the accuracy of the unit may be temporarily affected.

**CAUTION** Powering the unit with AC power while the jumper is set to DC may permanently damage the transmitter.

Refer to Figure 1 for the location of the AC / DC jumper. Place the shorting jumper across either the two pins marked AC or the two pins marked DC.

![Figure 1: AC/DC jumper](image1)

2-wire 4-20 mA Current Operation

**CAUTION** DO NOT EXCEED SPECIFIED SUPPLY VOLTAGE RATINGS. PERMANENT DAMAGE NOT COVERED BY WARRANTY WILL RESULT. SIMULTANEOUS OUTPUTS ARE NOT DESIGNED FOR AC VOLTAGE OPERATION.

The connections to the transmitter are made through terminals 2 and 3 on the terminal block as shown in Figure 2. The terminal block is removable and each of the terminals are labeled underneath the terminal block on the circuit board. Polarity is indicated by +IOUT and -IOUT. The AC/DC selection jumper should be set for DC operation.

![Figure 2: Current output wiring](image2)

3-wire 0-10 V and 0-5 V Voltage Operation

**CAUTION** DO NOT EXCEED SPECIFIED SUPPLY VOLTAGE RATINGS. PERMANENT DAMAGE NOT COVERED BY WARRANTY WILL RESULT.

The connections to the transmitter are made to Terminals 1, 2, and 3 on the terminal block as shown in Figure 3. The terminal block is removable and each of the terminals are labeled underneath the terminal block on the circuit board. Polarity is indicated by PWR, COM, and +VOUT. When connecting using a DC power source, make sure the AC/DC selection jumper is set for DC. If the polarity of the transmitter is inadvertently reversed, the unit will not function properly, but no damage will be done to the transmitter. When connecting to an AC power source, make sure the AC/DC selection jumper is set for AC. When using AC power either lead of the power supply may be connected to PWR and COM without affecting the operation of the transmitter.

![Figure 3: Voltage output wiring](image3)

The range of appropriate receiver load resistances (RL) for the power supply voltage available is given by the formula listed below. Shielded 2-wire cable is recommended for control loop wiring. Ground the shield at the power supply end only.

\[
R_L = \frac{V_{ps} - 10.0}{20 \text{ mA DC}}
\]

The maximum length of connecting wire between the transmitter and the receiver is a function of wire size and receiver resistance. That portion of the total current loop resistance represented by the resistance of the connecting wires should not exceed 10% of the receiver resistance. For extremely long runs (over 1,000 feet), it is desirable to select receivers with lower resistances in order to keep the size and cost of the connecting leads as low as possible. In installations where the connecting run is no more than 100 feet, connecting lead wire as small as No. 22 ga. can be used.

The minimum receiver load is 1K Ω. The resistance due to the wire should be low compared to the receiver load resistance. While the voltage at the terminal block remains unchanged with a 10 mA current flow, resistive losses in the wiring do cause errors in the voltage delivered to the receiver. For a 1% accurate gauge, the resistance of the wires should be less than 0.1% of the value of the receiver load resistance. This will keep the error caused by the current flow below 0.1%.

The output across +VOUT and COM will be either 0-5 V, 0-10 V, or the inverse depending on the dip switch setting. See DIP Switch Setting Section for more information.

\[
R_L = \frac{V_{ps} - 10.0}{20 \text{ mA DC}}
\]
Simultaneous Current and Voltage Operation

**CAUTION**

DO NOT EXCEED SPECIFIED SUPPLY VOLTAGE RATING. PERMANENT DAMAGE NOT COVERED BY WARRANTY WILL RESULT. SIMULTANEOUS OUTPUTS ARE NOT DESIGNED FOR AC VOLTAGE OPERATION.

The connections to the transmitter are made to Terminals 1, 2, and 3 on the terminal block as shown in Figure 4. The terminal block is removable and each of the terminals are labeled underneath the terminal block on the circuit board. Polarity is indicated by PWR, COM, and +VOUT. The AC/DC selection jumper should be set for DC operation.

The voltage output and the power supply must have separate wire leads that are only joined at terminal 2 of the transmitter. Additional error may occur for the voltage output if a single wire is used or if the wires are joined at the power supply or receiver.

**NOTE:** POWER AND VOLTAGE RECEIVER - "must be separate wires and both wired to..."

*Figure 4: Simultaneous current and voltage output wiring*

For the current output, the maximum allowable loop resistance (wiring + receiver resistance) is dependent on the power supply. The maximum loop voltage drop must not reduce the transmitter voltage below 17 V. The maximum loop resistance can be calculated using the following equation:

\[ R_{\text{MAX}} = \frac{(V_{\text{PS}} - 17.0)}{20 \text{ mA}} \]

Where \( V_{\text{PS}} \) is the power supply voltage

The equation uses 17.0 instead of 10.0 used in current only equation. This represents the minimum voltage supply which is higher on the simultaneous output configuration due to the requirements of the voltage outputs.

Shielded 4-wire cable is recommended for control loop wiring. Ground the shield at the power supply end only. Should the polarity of the transmitter or receiver be inadvertently reversed, the unit will not function properly, but no damage will be done to the transmitter.

For voltage outputs, the minimum receiver load is 1K Ω. The resistance due to the wire should be low compared to the receiver load resistance. While the voltage at the terminal block remains unchanged with a 10 mA current flow, resistive losses in the wiring do cause errors in the voltage delivered to the receiver. For a 1% accurate gauge, the resistance of the wires should be less than 0.1% of the value of the receiver load resistance. This will keep the error caused by the current flow below 0.1%.

The output across +VOUT and COM will be either 0-5 V, 0-10 V, or the inverse depending on the dip switch setting. See DIP Switch Setting Section for more information.

**DIP SWITCH SETTINGS**

DIP Switches can be located next to the terminal block as shown in Figure 5. A small screw driver or pen can be used to change the position of the switches.

**WARNING**

All power should be turned off to the transmitter before adjusting the dip switch settings to avoid electrical shock.

*Figure 5: DIP switch settings*

**Factory Settings**

Mode = Unidirectional (except on MS2-XX1X models)
Range = Highest Range Setting (0.5, 5, or 28 in w.c.)
Units = In w.c.
Voltage Output Range = 10 V
Direct / Reverse Output Action = Direct

**Setting the Pressure Range**

Ranges are selected by adjusting DIP Switch Positions 1 and 2 according to the below tables. The range also depends on the units selected (Refer to Setting the Engineering Units Section) and if the input is set for unidirectional or bidirectional (Refer to the Setting for Unidirectional or Bidirectional Section). The tables below show the maximum full scale value for the selected range and selected units. If the unit is set to unidirectional, the ranges are all zero based. If the unit is set for bidirectional, the ranges will be ± the maximum full scale value shown in the tables below.

**DIP Switch | Full Scale Range for MS2-X101**

**Setting for Unidirectional or Bidirectional**

The Models MS2-X101 and MS2-X102 models are unidirectional only. The Bidirectional models MS2-X103, MS2-X111 and MS2-X112 can be changed to measure pressure in one direction at a reduced accuracy by changing the setting of DIP Switch 3.

- When the switch is in the ON direction, the transmitter will be set for Unidirectional and will be 0 based (i.e. 0 to 5 in w.c.).
- When the switch is in the OFF position, the transmitter will be set for Bidirectional and will be ± the maximum of the selected range (i.e. ±5 in w.c.).
- For unidirectional units only, switch has no effect and unit will remain in unidirectional mode.
Setting the Engineering Units
Magnesense® II comes with the selection of four engineering units (in w.c., Pa, mm w.c., or kPa). The engineering units are selected using DIP Switch 4 and 5. The units will be displayed on the optional LCD display.

<table>
<thead>
<tr>

</tbody>
</table>

Setting the Output Voltage Range
Voltage output can be either 0-10 V or 0-5 V depending on the position of DIP Switch 6.

- When the switch is in the ON position, the output will be 0-10 V
- When the switch is in the OFF position, the output will be 0-5 V

Setting the Input / Output Action
The output will either directly or indirectly follow the input based on the position of DIP Switch 7.

- When the switch is in the ON position, the output directly follows the input (i.e. output increases as the input increases)
- When the switch is in the OFF position, the output acts in reverse of the input (i.e. output decreases as the input increases)

CALIBRATION

**NOTICE** Once the zero or span calibration button is released, there is a 5 second delay before the change takes effect. This delay is used to prevent stress related offsets on the lower ranges.

**NOTICE** The security level that is set in the Programming Menu Section of the manual will determine which calibrations, if any, may be adjusted by the user.

Zero Calibration
Ensure both pressure ports are either vented to atmospheric pressure or have equal pressure applied then press the zero button for 3 seconds. If either the remote or local LCD is present, the display will read ERR and then sequence back to the home display.

SPAN Calibration
The span calibration can only be adjusted after completing the zero calibration. It must be completed within 5 minutes of the last zero calibration. The span calibration button will be ignored until the zero calibration is completed. Apply the maximum full-scale pressure value, indicated by the dip switch setting, to the positive port. (i.e. the pressure value corresponding to 20 mA, 5 V, or 10 V depending on selected output). Press and hold the span button for 3 seconds. If either the remote or local LCD is present, the display will read ERR and then sequence back to the home display. If the span calibration is attempted before adjusting the zero calibration, the ERR error message will flash on the display.

LCD DISPLAY
The Magnesense® II can be ordered with an optional, integral LCD. If the display is not needed for normal operation, the transmitter can be ordered without the LCD. An A-MS2-LCD field upgradeable display is available. It comes with a housing cover with the overlay cut out for the display. The display will plug into the pins as shown in Figure 6.

Another option for models that do not have a display would be to use a Model A-435-A remote display tool which can plug into the connector shown in Figure 7. The remote display tool has two buttons that function identically to the buttons on the PCB.

![Figure 7](image_url)

Display Error Messages
- **Err1**: The applied pressure is greater than the maximum span value causing an Over Range Error.
- **Err2**: The applied pressure is less than the minimum span value causing an Under Range Error.
- **Err3**: When the span or zero buttons are pressed, the pressure value is out of the range to allow a correct setting. This may be due to a sensor failure or incorrect pressure being applied.
- **Err4**: The sensor is damaged.

PROGRAMMING MENUS

Home Menu
During normal operation, the display will be in the Home Menu and will display the current measured pressure and the engineering units.

Menu Access Security
While in the Home Menu, press and hold the Zero and Span buttons simultaneously until **SECURITY** appears on the display in order to access the other programming menus. Upon releasing the buttons, the display will indicate the current security level.

If the current security level is the security level desired (i.e. Security Level 0), press and hold the span button for three seconds to enter the Pressure, Velocity, or Air Flow Menu.

If the security level is not the desired level, the security level can be changed temporarily to a lower security level or permanently to a higher level of security by pressing the zero button. A security code will be shown on the display and it can be changed to one of the codes listed in the below table. The span button chooses which digit and the zero button increments the value of that digit. Pressing and holding the span button will store the value.

</tbody>
</table>

The level of access to the programming menus and the calibration is limited based on the security level. The above table details the level of access for each security level.
Mode Selection / Digital Dampening Menu
From the home display, pressing the span and zero button simultaneously for three seconds will access the Menu Security Level. If the level is set to 0 or 1, pressing and holding the span button for three seconds a second time will access the Mode Selection Menu. The display will default to Pressure when first powered up. Pressing the zero button will cycle to Velocity and Flow.

Once the desired Mode is displayed, pressing and holding the span button for three seconds will save the selected mode and display the digital dampening or averaging parameter. This parameter stabilizes the output and the display by averaging the readings. There are 2.5 readings taken each second and the user can select the number of seconds that they would like to average up to 240 seconds. The display and the output will continue to update at a rate of 2.5 updates per second, but the moving average is used for these updates.

PRESSURE MODE
Maximum Output Adjustment
If the Pressure Mode was selected, pressing and holding the span after adjusting the digital dampening will enter the Pressure Mode. In this menu, the maximum output pressure (POH) can be adjusted to any pressure between the lowest dip switch range to the highest dip switch range. If the dip switch settings are preferred over manually setting the range, the POH parameter can be set to off.

VELOCITY MODE
K-Factor Adjustment
If the Velocity Mode was selected, pressing and holding the span after adjusting the digital dampening will enter the Velocity Mode and the transmitter will display the engineering unit that has been selected by the dip switch. Pressing and holding the span button for three seconds will enter the K – Factor adjustment. The K – Factor can be adjusted between 0.001 to 9.999. The K-Factor can be adjusted by pressing the span button to select the digit and pressing the zero button to increment the value of the digit. Pressing and holding the span button for three seconds will enter the Maximum Output Adjustment parameter.

Maximum Output Adjustment
The maximum output can be equivalent to a velocity or a pressure. After adjusting the K-Factor, the display will indicate if the adjustment is set for pressure or velocity. Pressing the zero button will toggle between the selections. Pressing and holding the span button for three seconds will enter the maximum output adjustment. The maximum output can be adjusted by pressing the span button to select the digit and pressing the zero button to increment the value of the digit. Pressing and holding the span button for three seconds will save this value and go to the Security Update Menu.

FLOW MODE
K-Factor Adjustment
If the Flow Mode was selected, pressing and holding the span after adjusting the digital dampening will enter the Flow Mode and the transmitter will display the engineering unit that has been selected by the dip switch. Pressing and holding the span button for three seconds will enter the K – Factor adjustment. The K – Factor can be adjusted between 0.001 to 9.999. The K-Factor can be adjusted by pressing the span button to select the digit and pressing the zero button to increment the value of the digit. Pressing and holding the span button for three seconds will save this value and go to the Security Update Menu.

FACTORY DEFAULT PROCEDURE
In order to reset all of the menu settings back to their factory programmed values, press and hold both the span and zero buttons simultaneously for 10 seconds until REC is displayed on the LCD. Upon releasing the buttons, the unit will be factory defaulted. Since resetting the transmitter will wipe out all changes, it is necessary to zero (and possibly span) the transmitter before taking measurements.

MAINTENANCE/REPAIR
Upon final installation of the Series MS2 Magnesense®II Differential Pressure Transmitter, no routine maintenance is required besides zeroing the transmitter occasionally. Besides routine calibration and installation of the LCD, the Series MS2 is not field serviceable and it is not possible to repair the unit. Field repair should not be attempted and may void warranty.

WARRANTY/RETURN
Refer to “Terms and Conditions of Sales” in our catalog and on our website. Contact customer service to receive a Return Goods Authorization number before shipping the product back for repair. Be sure to include a brief description of the problem plus any additional application notes.

APPENDIX I
Air Velocity / Air Flow Calculations
Velocity is calculated using the below equation:

\[ \text{Velocity}(\text{fpm}) = \text{K-Factor} \times 4004.4 \times \sqrt{\text{Diff. Press. (in of w.c.)}} \]

Velocity in m/s is then calculated from the equation:

\[ \text{Velocity}(\text{m/s}) = \text{Velocity}(\text{fpm}) \times 0.00508 \]

Flow is calculated using the below equation:

\[ \text{Flow}(\text{cfm}) = \text{Area}(\text{Ft}^2) \times \text{K-Factor} \times 4004.4 \times \sqrt{\text{Diff. Press. (in of w.c.)}} \]

\[ \text{Flow}(\text{m}^3/\text{h}) = \text{Flow (cfm)} \times 1.6992 \]
